**Step 1: Achieve Temporary Hemostasis**

**Insert MynxGrip**

Insert MynxGrip into existing procedural sheath up to the white shaft marker.

**Inflate the Balloon**

Inflate the balloon until the black marker is fully visible on the inflation indicator and close stopcock.

**Gently Pull Back Two Stops**

- Grasp black handle and withdraw catheter until the balloon abuts the distal tip of the procedural sheath (first point of resistance).
- Continue to withdraw until the balloon abuts the arteriotomy site (second point of resistance).
- While holding adequate tension on device handle, open stopcock on procedural sheath.

**Result**

Temporary hemostasis is achieved.

**Step 2: Place the Sealant**

**Advance the Sealant**

A. Lighten hold on black handle

B. Grasp procedural sheath and withdraw it from tissue tract

C. Continue retracting until shuttle locks onto black handle

**Unsheath the Sealant**

- Ensure adequate tension is employed on the black handle to keep balloon abutted against the arteriotomy.
- Immediately grasp advancer tube at skin and gently advance until single marker is fully visible.
- Hold for up to 30 seconds.
- Lay device down for up to 90 seconds.

**Result**

Sealant is in place.

**Step 3: Remove the Device**

**Lock, Stabilize, Deflate**

**Lock Syringe**

- Lock syringe to maximum negative position.

**Stabilize Artery**

- Stabilize by applying light fingertip compression proximal to the insertion site.
- Lightly grasp advancer tube at skin with thumb and forefinger; realign with tissue tract.

**Deflate the Balloon**

- Open stopcock to deflate balloon.
- To ensure complete balloon deflation, wait until air bubbles and fluid have stopped moving through the inflation tubing.

**Remove Catheter and Advancer Tube**

- Withdraw catheter through the advancer tube lumen.

**NOTE:** If unusual resistance is felt during catheter withdrawal, pull the advancer tube and balloon catheter together through the tissue tract.
- Remove advancer tube from the tissue tract.

**Result**

Temporary hemostasis is achieved.

**Step 1: Achieve Temporary Hemostasis**

**Prepare Balloon**

- Fill locking syringe with 2-3 ml of sterile saline.
- Attach to stopcock and draw vacuum.
- Inflate balloon until black marker on inflation indicator is fully visible.
- Deflate balloon and leave syringe at neutral.
- Do not remove sealant sleeve.

**Result**

Patient-friendly closure.

**Indications for Use, Precautions, and Warnings**

**Indications for Use**

The MynxGrip Vascular Closure Device is indicated for use to seal femoral arterial access sites while reducing times to hemostasis and ambulation in patients who have undergone diagnostic or interventional endovascular procedures utilizing a 5F, 6F or 7F procedural sheath.

**Precautions and Warnings**

- Use MynxGrip device only by a trained licensed physician or healthcare professional.
- Do not use if the sterilization indicator dot on the pouch is yellow/gold.
- Do not use if components or packaging appear to be damaged or defective or if any portion of the packaging has been previously opened.
- Do not use in patients with a known allergy to PEG.
- Do not use if the puncture site is located above the most inferior border of the inferior epigastric artery (IEA) and/or above the inguinal ligament, since such a puncture site may result in a retroperitoneal hematoma/bleed.

**Prep MynxGrip**

- Hold the MynxGrip Vascular Closure Device by the shuttle while removing from the tray.
- Remove device.

**Secure Extravascular Closure**
